

SPECIFICATION AMENDMENTS

IN THE SPECIFICATION:

1. Please replace the paragraph beginning at page 8, line 29 with the following amended paragraph:

FIGURE 1 depicts network system 10 connected to Internet ~~[[14]]~~16 using wireless host 12. Although network system 10 is shown connected to Internet ~~[[14]]~~16, in other embodiments, network system 10 may connect other information handling systems, other network systems (not shown) or merely be a stand-alone network system.

2. Please replace the paragraph beginning at page 10, line 27 with the following amended paragraph:

Generally, being within signal range 18 does not automatically determine that a device is connected or will connect to network system 10. For example, client 35, despite being within signal range 18, may or may ~~[[no]]~~ not access or connect with network system 10. Generally, when an information handling system such as client 35 enters within signal range 18, client 35 will attempt to connect with network system 10. However, if client 35 does not have access to network system 10 (e.g., user does not know the access code), client 35 may choose to remain within signal range 18 but not connect to network system 10 or to connect at some later time. Even if client 35 has access privileges to connect with network system 10, client 35 may elect to stay within signal range 18 but remain a separate device not connected to network system 10.
